Information

ImageQuiz

A responder- or clicker- type tool designed for synchronous, though not necessarily co-located, classroom settings. In addition to the typical responder functionality, an image can be displayed with an accompanying question or note, each student can click on the image to indicate a response, and the aggregate all student clicks viewed overlain on the image. (This work is based a standalone, PHP-based, proof-of-concept application, and examples of its use and exploration of applicable pedagogies can be found at <http://geopocket.org>.)
