

## sakai.properties database auto.ddl (2.x)

 On startup, Sakai will generate all database objects (tables, keys, constraints, etc.) automatically, obviating the need to run DDL scripts manually per the `sakai.properties` setting `auto.ddl`.

```
# establish auto.ddl - on by default
auto.ddl=true
#auto.ddl=false
```

 Once the database schema is created you should set `auto.ddl=false`.
