

Subversion Commit Privilege

Subversion Commit Privilege

Some translators may be granted subversion commit rights for properties files within Sakai. This is a privilege which is granted only after a developer has proven to be active and competent in the translation process.

Subversion Commit Process

1. Open a task in **JIRA** specifying what you are doing:
 - The Component should be *Translation*
 - The Affects Version can be left set to the current release or default (i.e., Unknown)
 - The Assign To should be set to yourself
 - The Summary and Description should be filled in appropriately.
 - Only one JIRA issue is required for translating multiple components within Sakai.
2. You should **check out** (or refresh) a trunk version of Sakai from subversion
3. **Update the properties files** (and optionally *.metaprops files if you're using the ResourceProperties editor)
4. **Build and Deploy** to a server for test
5. **Verify** each module appears as expected (and doesn't crash!)
6. **Commit** each subversion module *explicitly* and reference the JIRA issue, for example:
\$ svn commit chat/calendar assignment -m "SAK-1234 update Japanese translation"
7. **"Resolve Issue"** in JIRA:
 - Set the Fix version to the latest release (e.g. currently *2.7.x [Tentative]*)
 - If you would like this change merged to a previous release, set that status to 'Merge' (e.g. *2.6.x Status* and re-assign to *Beth Kirschner*).
8. **Important:** Once a JIRA issue has been resolved, you must open a new JIRA ticket for additional commits
