

8 - Measure activity by user

This data would be anonymous to protect privacy.

- Researchers want to be able to characterize usage by individuals, to be able to find things like the average number of sites a user belongs to, the average number of pages a user views in a term, etc.
- System Administrators want to be able to model user behaviors in testing that are consistent with actual individual user behavior. For example, what's the average number of pages an individual views in a single session?

The sample user report below attempts to define information to capture on a per-user basis, which would allow us to develop models of general user types or activity.
